

Exception Handling in Python

Exception handling is the difference between a program that crashes and a program that keeps running while gracefully dealing with any errors. It is a necessary skill regardless if one is writing a small script or a epically large program. In this document, we will examine a few common scenarios

Overview of Exception Handling

- **You are importing data from outside the python module**
- **You are using a resource from outside the python module**
- **You are using a method from outside the python module which throws an exception**
-
